## SUBSTITUTED IMIDAZO RING SYSTEMS AND METHODS

## 5 CROSS REFERENCE TO RELATED APPLICATIONS

The present invention claims priority to U.S. Provisional Application Serial Nos. 60/580989, filed June 18, 2004, which is incorporated herein by reference.

## BACKGROUND

10 In the 1950's the 1*H*-imidazo[4,5-*c*]quinoline ring system was developed, and 1-(6-methoxy-8-quinoliny)-2-methyl-1*H*-imidazo[4,5-*c*]quinoline was synthesized for possible use as an antimalarial agent. Subsequently, syntheses of various substituted 1*H*-imidazo[4,5-*c*] quinolines were reported. For example, 1-[2-(4-piperidyl)ethyl]-1*H*-imidazo[4,5-*c*]quinoline was synthesized as a possible anticonvulsant and cardiovascular agent. Also, several 2-oxoimidazo[4,5-*c*]quinolines have been reported.

15 Certain 1*H*-imidazo[4,5-*c*]quinolin-4-amines and 1- and 2-substituted derivatives thereof were later found to be useful as antiviral agents, bronchodilators and immunomodulators. Subsequently, certain substituted 1*H*-imidazo[4,5-*c*] pyridin-4-amine, quinolin-4-amine, tetrahydroquinolin-4-amine, naphthyridin-4-amine, and  
20 tetrahydronaphthyridin-4-amine compounds as well as certain analogous thiazolo and oxazolo compounds were synthesized and found to be useful as immune response modifiers, rendering them useful in the treatment of a variety of disorders.

There continues to be interest in and a need for compounds that have the ability to modulate the immune response, by induction of cytokine biosynthesis or other  
25 mechanisms.

A discussion of the use of prodrugs is provided by T. Higuchi and W. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A. C. S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American  
 20 Pharmaceutical Association and Pergamon Press, 1987.

## Preparation of the Compounds

Compounds of the invention may be synthesized by synthetic routes that include processes analogous to those well known in the chemical arts, particularly in light of the description contained herein. The starting materials are generally available from commercial sources such as Aldrich Chemicals (Milwaukee, Wisconsin, USA) or are readily prepared using methods well known to those skilled in the art (e.g. prepared by methods generally described in Louis F. Fieser and Mary Fieser, *Reagents for Organic Synthesis*, v. 1-19, Wiley, New York, (1967-1999 ed.); Alan R. Katritzky, Otto Meth-Cohn, Charles W. Rees, *Comprehensive Organic Functional Group Transformations*, v 1-6, Pergamon Press, Oxford, England, (1995); Barry M. Trost and Ian Fleming, *Comprehensive Organic Synthesis*, v. 1-8, Pergamon Press, Oxford, England, (1991); or *Beilsteins Handbuch der organischen Chemie*, 4, Aufl. Ed. Springer-Verlag, Berlin, Germany, including supplements (also available via the Beilstein online database)).

For illustrative purposes, the reaction schemes depicted below provide potential routes for synthesizing the compounds of the present invention as well as key intermediates. For more detailed description of the individual reaction steps, see the EXAMPLES section below. Those skilled in the art will appreciate that other synthetic routes may be used to synthesize the compounds of the invention. Although specific starting materials and reagents are depicted in the reaction schemes and discussed below, other starting materials and reagents can be easily substituted to provide a variety of derivatives and/or reaction conditions. In addition, many of the compounds prepared by the methods described below can be further modified in light of this disclosure using conventional methods well known to those skilled in the art.

In the preparation of compounds of the invention it may sometimes be necessary to protect a particular functionality while reacting other functional groups on an intermediate. The need for such protection will vary depending on the nature of the particular functional group and the conditions of the reaction step. Suitable amino protecting groups include acetyl, trifluoroacetyl, *tert*-butoxycarbonyl (Boc), benzyloxycarbonyl, and 9-fluorenylmethoxycarbonyl (Fmoc). Suitable hydroxy protecting groups include acetyl and silyl groups such as the *tert*-butyl dimethylsilyl group. For a general description of protecting groups and their use, see T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, New York, USA, 1991.

Conventional methods and techniques of separation and purification can be used to isolate compounds of the invention or pharmaceutically acceptable salts thereof, as well as various intermediates related thereto. Such techniques may include, for example, all types of chromatography (high performance liquid chromatography (HPLC), column chromatography using common absorbents such as silica gel, and thin layer chromatography, recrystallization, and differential (i.e., liquid-liquid) extraction techniques.

Intermediates useful for making substituted imidazoquinolines and imidazonaphthyridines can be prepared according to Reaction Scheme I where X''' and R<sub>8a</sub> are as defined above; Hal is chloro, bromo, or iodo; R<sub>Y</sub> and R<sub>Z</sub> join to form a fused benzene ring optionally substituted by one or more R<sub>a2</sub> groups or a fused pyridine ring optionally substituted by one or more R<sub>b</sub> groups, wherein R<sub>a2</sub> and R<sub>b</sub> are as defined above; and R<sub>1a</sub> can be those groups included in R<sub>1-4a</sub>, R<sub>1-4b</sub>, R<sub>1-4c</sub>, R<sub>1-4d</sub>, R<sub>1-5a</sub>, R<sub>1-5b</sub>, R<sub>1-6</sub>, and R<sub>1-7</sub> as defined above that do not include substituents that one skilled in the art would recognize as being susceptible to oxidation in step (2). These substituents include -S- and heteroaryl groups.

In step (1) of Reaction Scheme I, a 3,4-diamine of Formula XXX is reacted with a carboxylic acid or carboxylic acid equivalent to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXXI. The carboxylic acid equivalent is selected such that it will provide the desired Hal-X'''- substituent in a compound of Formula XXXI. Suitable carboxylic acid equivalents include orthoesters of Formula Hal-X'''-C(O-alkyl)<sub>3</sub>, 1,1-dialkoxyalkyl alkanoates of Formula Hal-X'''-C(O-alkyl)<sub>2</sub>(O-C(O)-alkyl), and acid halides of Formula Hal-X'''-C(O)Cl or Hal-X'''-C(O)Br.

The reaction with an acid halide of Formula Hal-X'''-C(O)Cl, such as chloroacetyl chloride, is conveniently carried out by combining the acid halide with a 3,4-diamine of Formula XXX in an inert solvent such as dichloromethane in the presence of a base such as triethylamine. The reaction can be carried out at ambient temperature, and the product can be isolated by conventional methods. The reaction may alternatively be carried out in two steps by first adding the acid halide of Formula Hal-X'''-C(O)Cl to a solution of the 3,4-diamine of Formula XXX in a suitable solvent such as dichloromethane at a sub-ambient temperature such as 0 °C. The amide intermediate can optionally be isolated using conventional techniques and then treated with a base such as aqueous potassium

carbonate or triethylamine in a suitable solvent such as dichloromethane, 1,2-dichloroethane, or ethanol or solvent system such as ethanol and water. The cyclization can be carried out at ambient temperature or at an elevated temperature such as the reflux temperature of the solvent.

5 Many compounds of Formula XXX, such as substituted quinolines and [1,5]naphthyridines, are known and can be readily prepared using known synthetic routes; see for example, U.S. Patent Nos. 4,689,338 (Gerster), 4,929,624 (Gerster et al.), 5,268,376 (Gerster), 5,389,640 (Gerster et al.), 6,194,425 (Gerster et al.), 6,331,539 (Crooks et al.), 6,451,810 (Coleman et al.), 6,541,485 (Crooks et al.), 6,660,747 (Crooks et al.), 6,670,372 (Charles et al.), 6,683,088 (Crooks et al.), 6,656,938 (Crooks et al.), 10 6,664,264 (Dellaria et al.), and U.S. Patent Publication Application No. US 2004/0147543 (Hays et al.).

In step (2) of Reaction Scheme I an imidazoquinoline or imidazonaphthyridine of Formula XXXI is oxidized to a 5*N*-oxide of Formula XXXII using a conventional 15 oxidizing agent capable of forming *N*-oxides. The reaction is conveniently carried out at ambient temperature by adding 3-chloroperoxybenzoic acid to a solution of a compound of Formula XXXI in a solvent such as chloroform or dichloromethane.

In step (3) of Reaction Scheme I a 5*N*-oxide of Formula XXXII is aminated to provide an amine of Formula XXXIII. Step (3) can be carried out by the activation of an 20 *N*-oxide of Formula XXXII by conversion to an ester and then reacting the ester with an aminating agent. Suitable activating agents include alkyl- or arylsulfonyl chlorides such as benzenesulfonyl chloride, methanesulfonyl chloride, or *p*-toluenesulfonyl chloride. Suitable aminating agents include ammonia, in the form of ammonium hydroxide, for example, and ammonium salts such as ammonium carbonate, ammonium bicarbonate, and 25 ammonium phosphate. The reaction is conveniently carried out by adding ammonium hydroxide to a solution of the *N*-oxide of Formula XXXII in a suitable solvent such as dichloromethane or chloroform and then adding *p*-toluenesulfonyl chloride. The reaction can be carried out at ambient temperature.

Steps (2) and (3) of Reaction Scheme I may alternatively be carried out as a one- 30 pot procedure by adding 3-chloroperoxybenzoic acid to a solution of a compound of Formula XXXI in a solvent such as dichloromethane or chloroform and then adding

ammonium hydroxide and *p*-toluenesulfonyl chloride without isolating the *N*-oxide compound of Formula XXXII.

In step (4) of Reaction Scheme I a compound of Formula XXXIII is treated with potassium phthalimide to provide a phthalimide-substituted compound of Formula XXXIV. The reaction is conveniently carried out by combining potassium phthalimide and compound of Formula XXXIII in a suitable solvent such as *N,N*-dimethylformamide (DMF). The reaction can be carried out at ambient temperature.

In step (5) of Reaction Scheme I a phthalimide-substituted compound of Formula XXXIV is deprotected to an aminoalkyl-substituted compound of Formula XXXV.

Removal of the phthalimide group is conveniently carried out by adding hydrazine to a solution or suspension of a phthalimide-substituted compound of Formula XXXIV in a suitable solvent such as ethanol. The reaction can be carried out at ambient temperature.

Alternatively, a compound of Formula XXXIII can be converted to an aminoalkyl-substituted compound of Formula XXXVa according to step (4a) of Reaction Scheme I.

The reaction can be carried out by adding an excess of an amine of Formula  $H_2N-R_{8a}$  to solution of a compound of Formula XXXIII in a suitable solvent such as methanol. Several amines of Formula  $H_2N-R_{8a}$  are commercially available. The reaction can be carried out at ambient temperature.

## Reaction Scheme I

Intermediates useful for making substituted imidazopyridines can be prepared according to Reaction Scheme II, where R<sub>A1</sub>, R<sub>B1</sub>, X''', and Hal are as defined above; Ph is phenyl; and R<sub>1</sub> includes the groups defined above in R<sub>1-4c</sub>, R<sub>1-5a</sub>, R<sub>1-5c</sub>, R<sub>1-6</sub>, and R<sub>1-7</sub>. In step (1) of Reaction Scheme II, a 2-phenoxypyridine-3,4-diamine of Formula XXXVI is converted to a 1H-imidazo[4,5-c]pyridine of Formula XXXVII by reaction with a halogen-substituted carboxylic acid equivalent. The reaction can be carried out as described in step (1) of Reaction Scheme I. When X''' is methylene, the reaction is conveniently carried out by combining a 2-phenoxypyridine-3,4-diamine of Formula XXXVI with ethyl chloroacetimidate hydrochloride in a suitable solvent such as chloroform. The reaction can be carried out at an elevated temperature such as 60 °C. Several 2-phenoxypyridine-3,4-diamines of Formula XXXVI are known or can be prepared by published methods. See, for example, U. S. Patent Nos. 6,545,016 (Dellaria et al.), 6,743,920 (Lindstrom et al.), and 6,797,718 (Dellaria et al.). Ethyl chloroacetimidate hydrochloride is a known compound that can be prepared according to the literature procedure: Stillings, M. R. et al., *J. Med. Chem.*, 29, pp. 2280-2284 (1986).

In step (2) of Reaction Scheme II, a halogen-substituted 1*H*-imidazo[4,5-*c*]pyridine of Formula XXXVII is aminated to provide an aminoalkyl-1*H*-imidazo[4,5-*c*]pyridin-4-amine of Formula XXXVIII. The reaction is conveniently carried out by adding a solution of ammonia in a suitable solvent such as methanol to a compound of Formula XXXVII and heating the reaction at an elevated temperature such as 150 °C.

Reaction Scheme II

Amide-substituted compounds of the invention can be prepared according to Reaction Scheme III, wherein R<sub>1a</sub>, R<sub>2-4a</sub>, R<sub>6</sub>, R<sub>8a</sub>, and X''' are as defined above, and R<sub>Y2</sub> and R<sub>Z2</sub> are each independently selected from the group consisting of hydrogen, halogen, alkyl, alkenyl, alkoxy, alkylthio, and -N(R<sub>9</sub>)<sub>2</sub>; or R<sub>Y2</sub> and R<sub>Z2</sub> join to form a fused benzene ring optionally substituted by one or more R<sub>a2</sub> groups; or R<sub>Y2</sub> and R<sub>Z2</sub> join to form a fused pyridine ring optionally substituted by one or more R<sub>b</sub> groups, wherein R<sub>a2</sub> and R<sub>b</sub> are as defined above. Amino-substituted compounds of Formula XXXIX can be prepared according to the methods described in Reaction Schemes I and II.

In Reaction Scheme III, an amino-substituted compound of Formula XXXIX is converted to an amide-substituted compound of Formula XIXe using conventional methods. For example, an amino-substituted compound of Formula XXXIX or a salt thereof can react with an acid chloride of Formula R<sub>2-4a</sub>C(O)Cl to provide a compound of Formula XIXe. Numerous acid chlorides of Formula R<sub>2-4a</sub>C(O)Cl are commercially available; others can be readily prepared using known synthetic methods. The reaction is conveniently carried out by adding the acid chloride of Formula R<sub>2-4a</sub>C(O)Cl to a solution of the aminoalkyl-substituted compound of Formula XXXIX in a suitable solvent such as chloroform, dichloromethane, DMF, or *N,N*-dimethylacetamide (DMA). Optionally a base such as triethylamine or *N,N*-diisopropylethylamine can be added. The reaction can be carried out at ambient temperature or a sub-ambient temperature such as 0 °C.

## Reaction Scheme III

In Reaction Scheme IV, an amino-substituted compound of Formula XXXIXa is treated with a chloroalkanesulfonyl chloride of Formula  $\text{Cl-R}_{3a}\text{S(O)}_2\text{Cl}$ . Amino-substituted compounds of Formula XXXIXa can be prepared according to the methods described in

10 Reaction Schemes I and II. The reaction is conveniently carried out by adding the chloroalkanesulfonyl chloride to a solution of the compound of Formula XXXIXa in a suitable solvent such as chloroform at ambient temperature. The isolable intermediate chloroalkanesulfonamide can then be treated with a base such as 1,8-

15 or diazabicyclo[5.4.0]undec-7-ene at ambient temperature in a suitable solvent such as DMF or chloroform to effect the cyclization and provide a compound of Formula XXIIIb.

## Reaction Scheme IV

Haloalkyl-substituted compounds of Formula XXXIII can be prepared as described in Reaction Scheme I. Reaction Scheme V can be carried out

by adding a substituted phenol of Formula H-O-R<sub>2-5</sub> to a compound of Formula XXXIII in a suitable solvent such as DMF to provide a compound of Formula XL. The reaction can be conveniently carried out in the presence of a base such as potassium carbonate at an elevated temperature such as 65 °C. Numerous phenols of Formula H-O-R<sub>2-5</sub> are commercially available; others can be prepared using known synthetic methods.

Reaction Scheme V

Compounds of the invention can also be prepared according to Reaction Scheme VI, wherein R<sub>1a</sub>, R<sub>Y</sub>, R<sub>Z</sub>, R<sub>2-5</sub>, and X<sub>a</sub> are as defined above. In step (1) of Reaction Scheme VI, a 3,4-diamine of Formula XXX is treated with a carboxylic acid or an equivalent thereof to provide a compound of Formula XLI. Suitable equivalents to carboxylic acid include acid anhydrides of Formula O[C(O)-X<sub>a</sub>-O-(X<sub>a</sub>)<sub>0-1</sub>-R<sub>2-5</sub>]<sub>2</sub> and acid chlorides of Formula Cl-C(O)-X<sub>a</sub>-O-(X<sub>a</sub>)<sub>0-1</sub>-R<sub>2-5</sub>. Some acid anhydrides and acid chlorides of these Formulas, such as phenoxyacetyl chloride and benzyloxyacetyl chloride, are commercially available; others can be prepared by known synthetic methods. The reaction is conveniently carried out according to the methods described in step (1) of Reaction Scheme I. The reaction with an acid chloride of Formula Cl-C(O)-X<sub>a</sub>-O-(X<sub>a</sub>)<sub>0-1</sub>-R<sub>2-5</sub> can also be carried out in acetonitrile at room temperature or at an elevated temperature, such as the reflux temperature of the solvent.

In step (2) of Reaction Scheme VI, the compound of Formula XLI is oxidized and aminated to provide a compound of Formula XXIIa. This step is conveniently carried out according to the conditions described in steps (2) and (3) of Reaction Scheme I.

Alternative oxidation conditions include the use of peracetic acid as the oxidizing agent in a solvent such as methyl acetate.

## Reaction Scheme VI

Compounds of the invention can be prepared according to Reaction Scheme VII, where  $R_{1a}$ ,  $R_Y$ ,  $R_Z$ ,  $R_{2-4a}$ ,  $Q''$ ,  $f$ ,  $g$ ,  $Hal$ , and  $X'''$  are as defined above.

In step (1) of Reaction Scheme VII, a haloalkyl-substituted compound of Formula XXXIII is treated with a cyclic diamine of Formula

in the presence of a base such as triethylamine or *N,N*-

diisopropylethylamine to provide a compound of Formula XLII. Such cyclic diamines, for example piperazine, are commercially available or can be readily synthesized by known methods. The reaction is conveniently carried out in a suitable solvent such as acetonitrile at an elevated temperature such as the reflux temperature of the solvent.

In step (2) of Reaction Scheme VII, a compound of Formula XLII is converted to a compound of Formula XXIVa using conventional techniques. For example, a compound of Formula XLII or a salt thereof can react with an acid chloride of Formula  $R_{2-4a}C(O)Cl$  or acid anhydride of Formula  $[R_{2-4a}C(O)]_2O$  to provide a compound of Formula XXIVa in which  $Q''$  is  $-C(O)-$ . In addition, a compound of Formula XLII can react with sulfonyl chloride of Formula  $R_{2-4a}S(O)_2Cl$  or a sulfonic anhydride of Formula  $(R_{2-4a}S(O)_2)_2O$  to provide a compound of Formula XXIVa in which  $Q''$  is  $-S(O)_2-$ . Numerous acid chlorides of Formula  $R_{2-4a}C(O)Cl$ , sulfonyl chlorides of Formula  $R_{2-4a}S(O)_2Cl$ , and sulfonic anhydrides of Formula  $(R_{2-4a}S(O)_2)_2O$  are commercially available; others can be readily prepared using known synthetic methods. The reaction is conveniently carried out by adding the acid chloride, sulfonyl chloride, or sulfonic anhydride to a solution of the compound of Formula XLII in a suitable solvent such as chloroform, dichloromethane, DMF, or DMA. Optionally a base such as triethylamine or *N,N*-diisopropylethylamine can be added. The reaction can be carried out at ambient temperature or a sub-ambient temperature such as 0 °C.

Sulfamides of Formula XXIVa, where Q" is  $-\text{S}(\text{O})_2-\text{N}(\text{R}_{8a})-$ , can be prepared by reacting a compound or salt of Formula XLII with sulfonyl chloride to generate a sulfamoyl chloride in situ, and then reacting the sulfamoyl chloride with an amine of formula  $\text{HN}(\text{R}_{8a})\text{R}_{2-4a}$ . Alternatively, sulfamides of Formula XXIVa can be prepared by reacting a compound of Formula XLII with a sulfamoyl chloride of Formula  $\text{R}_{2-4a}(\text{R}_{8a})\text{N}-\text{S}(\text{O})_2\text{Cl}$ . Many sulfonyl chlorides of Formula  $\text{R}_{2-4a}\text{S}(\text{O})_2\text{Cl}$  and amines of Formula  $\text{HN}(\text{R}_{8a})\text{R}_{2-4a}$ , and some sulfamoyl chlorides of Formula  $\text{R}_{2-4a}(\text{R}_{8a})\text{N}-\text{S}(\text{O})_2\text{Cl}$  are commercially available; others can be prepared using known synthetic methods.

Compounds of Formula XXIVa, wherein Q" is a bond, can be prepared by reacting a compound or salt of Formula XLII with a variety of commercially available electrophiles, including alkyl halides and epoxides. The reaction can be carried out as described above for the reaction of a compound of Formula XLII with acid chlorides or sulfonyl chlorides.

Compounds of the invention can also be prepared according to Reaction Scheme VIII, wherein  $\text{R}_{1a}$ ,  $\text{R}_Y$ ,  $\text{R}_Z$ ,  $\text{R}_{3'}$ ,  $\text{A}''$ ,  $\text{R}_f$ ,  $p$ ,  $\text{Hal}$ , and  $\text{X}'''$  are as defined above. In Reaction Scheme VIII, a halogen-substituted compound of Formula XXXIII is treated with a substituted cyclic amine of Formula

Many substituted cyclic amines are commercially available; others can be made by known methods. The reaction can be carried out according to the method described in step (1) of Reaction Scheme VII or the method described in Reaction Scheme V. These reaction conditions can also be used to treat a compound of Formula XXXIII with thiomorpholine to provide a compound of Formula XXIV wherein  $\text{R}_{2-6}$  is

## Reaction Scheme VIII

For some embodiments, compounds of the invention are prepared according to Reaction Scheme IX, wherein  $\text{R}_Y$ ,  $\text{R}_Z$ ,  $\text{X}$ ,  $\text{Q}$ ,  $\text{Hal}$ ,  $\text{R}_8$ , and  $\text{R}_4$  are as defined above;  $\text{Boc}$  is a *tert*-butoxycarbonyl group; and  $\text{R}_{2z}$  is selected from the group consisting of

$\text{R}_{2-5}$ ,  $\text{R}_{2-6}$ ,  $\text{R}_{3a}$ ,  $\text{R}_6$ , and  $\text{R}_{8a}$  are as defined above.

In steps (1) through (3) of Reaction Scheme IX, a 3,4-diamine of Formula XLIII is cyclized to a compound of Formula XLIV, which is then oxidized and aminated to a compound of Formula XLVI. Steps (1) through (3) of Reaction Scheme IX can be carried out as described for steps (1) through (3) of Reaction Scheme I. Compounds of Formula XLIII are known and can be readily prepared using known synthetic routes; see for

example, U.S. Patent Nos. 6,331,539 (Crooks et al.), 6,451,485 (Crooks et al.), 6,451,810 (Coleman et al.), and 6,677,349 (Griesgraber).

In step (4) of Reaction Scheme IX, a halogen-substituted compound of Formula XLVI is treated according to any of the methods or combination of methods described in Reaction Schemes I, III, IV, V, VII, and VIII to introduce the R<sub>2z</sub> group and provide a compound of Formula XLVII. For example, the halogen-substituted compound of Formula XLVI can be treated according to the methods described in steps (4) and (5) of Reaction Scheme I followed by the method described in Reaction Scheme IV to provide a compound of Formula XLVII wherein R<sub>2z</sub> is

. In another example, step (4) of Reaction Scheme IX can be carried out according to the method of Reaction Scheme V to provide a compound of Formula XLVII wherein R<sub>2z</sub> is -X'''-O-R<sub>2-5</sub>.

In step (5) of Reaction Scheme IX, the Boc group of the compound of Formula XLVII is removed to provide a 1-amino-substituted compound of Formula XLVIII. The deprotection is conveniently carried out by adding a solution of hydrogen chloride in a suitable solvent such as dioxane to a solution of the compound of Formula XLVII in a suitable solvent or solvent mixture such as methanol and dichloromethane. The reaction can be carried out at ambient temperature.

In step (6) of Reaction Scheme IX, a 1-amino-substituted compound of Formula XLVIII is converted to a compound of Formula XLIX using conventional methods. For example, a 1-amino-substituted compound of Formula XLVIII or a salt thereof can react with an acid chloride of Formula R<sub>4</sub>C(O)Cl to provide a compound of Formula XLIX in which Q is -C(O)-. In addition, a 1-amino-substituted compound of Formula XLVIII can react with sulfonyl chloride of Formula R<sub>4</sub>S(O)<sub>2</sub>Cl or a sulfonic anhydride of Formula (R<sub>4</sub>S(O)<sub>2</sub>)<sub>2</sub>O to provide a compound of Formula XLIX in which Q is -S(O)<sub>2</sub>-. The reaction can be carried out according to one of the methods described in step (2) of Reaction Scheme VII.

Sulfamides of Formula XLIX, where Q is -S(O)<sub>2</sub>-N(R<sub>8</sub>)-, can be prepared by reacting a compound or salt of Formula XLVIII with sulfuryl chloride to generate a sulfamoyl chloride in situ, and then reacting the sulfamoyl chloride with an amine of

formula  $\text{HN}(\text{R}_8)\text{R}_4$ . Alternatively, sulfamides of Formula XLIX can be prepared by reacting a compound of Formula XLVIII with a sulfamoyl chloride of formula  $\text{R}_4(\text{R}_8)\text{N-S}(\text{O})_2\text{Cl}$ .

Compounds of Formula XLIX, wherein Q is  $-\text{C}(\text{O})-\text{N}(\text{R}_8)-$ ,  $-\text{C}(\text{O})-\text{N}(\text{R}_8)-(\text{CO})-$ ,  $-\text{C}(\text{S})-\text{N}(\text{R}_8)-$ , or  $-\text{C}(\text{O})-\text{N}(\text{R}_8)-\text{S}(\text{O})_2-$  can be prepared by reacting a compound of Formula XLVIII with an isocyanate of Formula  $\text{R}_4\text{N}=\text{C}=\text{O}$  or carbamoyl chloride of Formula  $\text{R}_4\text{N}-(\text{R}_8)-\text{C}(\text{R}_6)\text{Cl}$ , an isothiocyanate of Formula  $\text{R}_4\text{N}=\text{C}=\text{S}$ , or a sulfonyl isocyanate of Formula  $\text{R}_4\text{S}(\text{O})_2\text{N}=\text{C}=\text{O}$ . Many compounds of these Formulas are commercially available; others can be prepared by known synthetic methods. The reaction is conveniently carried out by adding the isocyanate, isothiocyanate, carbamoyl chloride, or sulfonyl isocyanate to a solution of the compound of Formula XLVIII in a suitable solvent such as DMF or chloroform at ambient temperature. Optionally a base such as triethylamine or *N,N*-diisopropylethylamine can be added.

## Reaction Scheme IX

- 5 Tetrahydroquinolines and tetrahydronaphthyridines of the invention can be prepared according to Reaction Scheme X, wherein  $R_{Ya}$  and  $R_{Za}$  join to form a fused benzene ring or a fused pyridine ring, each of which is optionally substituted by one or more  $R_g$  groups, wherein  $R_g$  is alkyl, alkoxy, or  $-N(R_9)_2$ ;  $R_w$  and  $R_x$  join to form a fused 5 to 7 membered saturated ring, optionally containing one heteroatom selected from the group consisting of N and S and optionally substituted by one or more  $R_g$  groups;  $R_{1d}$  can be those groups included in  $R_{1-4a}$ ,  $R_{1-4b}$ ,  $R_{1-4c}$ ,  $R_{1-4d}$ ,  $R_{1-6}$ , and  $R_{1-7}$  as defined above that do not include those substituents that one skilled in the art would recognize as being susceptible to reduction under the acidic hydrogenation conditions of the reaction;  $R_{2y}$  is selected from the group consisting of
- 10

R<sub>3a</sub> are as defined above, X<sub>d</sub> is C<sub>1-4</sub> alkylene, and R<sub>2-4d</sub> and R<sub>2-6d</sub> are subsets of R<sub>2-4</sub> and R<sub>2-6</sub> as defined above that do not include those substituents that one skilled in the art would recognize as being susceptible to reduction under the acidic hydrogenation conditions of the reaction. These susceptible groups include, for example, alkenyl, alkynyl, and aryl groups and groups bearing nitro substituents. Compounds of Formula L can be prepared according to one of the methods described in Reaction Scheme III, IV, VII, VIII, and IX.

In Reaction Scheme X, a substituted 1*H*-imidazo[4,5-*c*]quinolin-4-amine of or 1*H*-imidazo[4,5-*c*]naphthyridin-4-amine of Formula L is reduced to a 6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-4-amine or 6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]naphthyridin-4-amine of Formula LI. The reaction is conveniently carried out under heterogeneous hydrogenation conditions by adding platinum (IV) oxide to a solution of the compound of Formula L in trifluoroacetic acid and placing the reaction under hydrogen pressure. The reaction can be carried out on a Parr apparatus at room temperature.

Reaction Scheme X

For some embodiments, imidazopyridines of the invention can be prepared according to Reaction Scheme Xa, wherein R<sub>A1</sub>, R<sub>B1</sub>, Ph, Hal, R<sub>1</sub>, and X''' are as defined above, and R<sub>2x</sub> is selected from the group consisting of

of Reaction Scheme Xa, an imidazopyridine of Formula XXXVII is treated according to one of the methods described in Reaction Scheme V, VII, or VIII to provide a compound

of Formula LII. In step (2) of Reaction Scheme Xa, an imidazopyridine of Formula LII is aminated according to the method described in step (2) of Reaction Scheme II.

Ammonium acetate can also be used as the aminating reagent in step (2).

5

### Reaction Scheme Xa

For some embodiments compounds of the invention can be prepared according to Reaction Scheme XI, wherein  $R_a$ ,  $R_{11}$ ,  $R_{1-1}$ ,  $R_{2-2}$ ,  $X'$ ,  $R'$ , and  $n$  are as defined above. In step (1) of Reaction Scheme XI, a 4-chloro-3-nitroquinoline of Formula LIV is reacted with an amine of the Formula

to form a compound of Formula LV. This reaction is conveniently carried out by adding the amine to a solution of a 4-chloro-3-nitroquinoline of Formula LIV in the presence of a base such as triethylamine. The reaction is carried out in a suitable solvent, such as dichloromethane or chloroform. Some amines of Formula

such as 2,2-dimethyl-1,3-dioxolane-4-methanamine are commercially available in both racemic and enantiomerically pure forms. Others can be prepared using known synthetic methods. Many compounds of Formula LIV are known or can be prepared using known synthetic methods, see for example, U.S. Patent Nos. 4,689,338 (Gerster) and 4,988,815 (André et al.), U.S. Patent Publication Application No. US 2004/0147543 (Hays et al.), and the documents cited therein.

The resultant compound of Formula LV can be reduced in step (2) of Reaction Scheme XI using a variety of methods to provide a quinoline-3,4-diamine of Formula LVI. The reaction can be carried out by hydrogenation using a heterogeneous hydrogenation

catalyst such as platinum on carbon. The hydrogenation is conveniently carried out in a Parr apparatus in a suitable solvent such as toluene or ethanol. The reaction can be carried out at ambient temperature.

Alternatively step (2) can be carried out using a one- or two-phase sodium dithionite reduction. The reaction is conveniently carried out using the conditions described by Park, K. K.; Oh, C. H.; and Joung, W. K.; *Tetrahedron Lett.*, 34, pp. 7445-7446 (1993) by adding sodium dithionite to a compound of Formula LV in a mixture of dichloromethane and water at ambient temperature in the presence of potassium carbonate and ethyl viologen dibromide, ethyl viologen diiodide, or 1,1'-di-*n*-octyl-4,4'-bipyridinium dibromide.

In step (3) of Reaction Scheme XI, a quinoline-3,4-diamine of Formula LVI is treated with a carboxylic acid equivalent to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula LVII. Suitable carboxylic acid equivalents include orthoesters of Formula  $R_{2-2}C(O\text{-alkyl})_3$ , 1,1-dialkoxyalkyl alkanoates of Formula  $R_{2-2}C(O\text{-alkyl})_2(O\text{-C(O)-alkyl})$ , and acid chlorides of Formula  $R_{2-2}C(O)Cl$ . The selection of the carboxylic acid equivalent is determined by the desired substituent at  $R_{2-2}$ . For example, triethyl orthoformate will provide a compound where  $R_{2-2}$  is hydrogen, and trimethyl orthovalerate will provide a compound where  $R_{2-2}$  is a butyl group. The reaction is conveniently carried out by adding the carboxylic acid equivalent to a quinoline-3,4-diamine of Formula LVI in a suitable solvent such as toluene. Optionally, catalytic pyridine hydrochloride or pyridium *p*-toluenesulfonate can be added. The reaction is carried out at a temperature high enough to drive off alcohol or water formed during the reaction. Conveniently, a Dean-Stark trap can be used to collect the volatiles.

Alternatively, step (3) can be carried out in two steps when an acid chloride of Formula  $R_{2-2}C(O)Cl$  is used as the carboxylic acid equivalent. The first step is conveniently carried out by adding the acid chloride to a solution of a quinoline-3,4-diamine of Formula LVI in a suitable solvent such as dichloromethane to afford an amide. Optionally, a tertiary amine such as triethylamine, pyridine, or 4-dimethylaminopyridine can be added. The reaction can be carried out at or below ambient temperature. The amide product can be isolated and optionally purified using conventional techniques before it is heated and cyclized to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula LVII. The cyclization reaction is conveniently carried out in a solvent such as ethanol or

methanol in the presence of a base such as triethylamine and may be carried out at an elevated temperature, such as the reflux temperature of the solvent.

In steps (4) and (5) of Reaction Scheme XI, a 1*H*-imidazo[4,5-*c*]quinoline of Formula LVII is first oxidized to a 5*N*-oxide of Formula LVIII, which is then aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula VI. Steps (4) and (5) of Reaction Scheme XI can be carried out according to the methods described in steps (2) and (3) of Reaction Scheme I.

In step (6) of Reaction Scheme XI, the ketal or acetal of Formula VI is converted to a diol of Formula IIa by acid-catalyzed hydrolysis. The reaction is conveniently carried out by adding a strong acid, such as hydrochloric acid, to a ketal or acetal of Formula VI. The reaction may be carried out at ambient temperature in a suitable solvent or solvent system such as a tetrahydrofuran/water mixture.

Conversion of a diol of Formula IIa to a ketal or acetal of Formula VI is also possible by using the method shown in step (7) of Reaction Scheme XI. In step (7), a diol of Formula IIa reacts with a ketone or aldehyde in the presence of an acid catalyst. Conditions for this reaction are well known to one skilled in the art. See, for example, T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, New York, USA, 1991, p. 178. Numerous ketones and aldehydes are commercially available; others can be prepared using known synthetic methods.

## Reaction Scheme XI

5 For some embodiments, tetrahydroquinolines of the invention can be prepared according to Reaction Scheme XII, wherein  $R_g$ ,  $R_{1-1}$ ,  $R_{11}$ ,  $R'$ , and  $n$  are as defined above, and  $R_{2-2b}$  and  $X'_b$  are subsets of  $R_{2-2}$  and  $X'$  as defined above that do not include those

10 substituents that one skilled in the art would recognize as being susceptible to reduction under the acidic hydrogenation conditions of step (1). These susceptible groups include, for example, alkenyl, alkynyl, and aryl groups and groups bearing nitro substituents. In step (1) of Reaction Scheme XII, an 1H-imidazo[4,5-c]quinoline of Formula IIb is reduced to a 6,7,8,9-tetrahydro-1H-imidazo[4,5-c]quinolin-4-amine of Formula IIIa. The reaction is conveniently carried out according to the method described in Reaction Scheme X.

In step (2) of Reaction Scheme XII, a diol of Formula IIIa is converted to a ketal or acetal of Formula VIIa according to the method described in step (7) of Reaction Scheme XI.

5

## Reaction Scheme XII

For some embodiments, compounds of the invention are prepared according to Reaction Scheme XIII, wherein R<sub>a2</sub>, R<sub>2-3</sub>, X'', and n are as defined above; and R<sub>1-3a</sub> is a subset of R<sub>1-3</sub> that includes the rings:

10

wherein Q<sub>b</sub> is a bond and R'', R<sub>3</sub>, and R<sub>4</sub> are defined as above. In step (1) of Reaction Scheme XIII, an amine of Formula NH<sub>2</sub>-X''-CH=CH<sub>2</sub> is added to a compound of Formula LIX to provide a substituted quinoline of Formula LX. The reaction can be carried out according to the method described in step (1) of Reaction Scheme XI. Several compounds of Formula LIX are known and can be made by known methods. See, for example, U.S. Patent No. 4,689,338 (Gerster). Amines of the Formula NH<sub>2</sub>-X''-CH=CH<sub>2</sub> are commercially available or can be readily prepared by known methods.

15

20

In steps (2) and (3) of Reaction Scheme XIII, the nitro group of a compound of Formula LX is first reduced to provide a quinoline-3,4-diamine of Formula LXI, which is cyclized to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula LXII. Steps (2) and (3) of Reaction Scheme XIII can be carried out according to the methods described in steps (2) and (3) of Reaction Scheme XI.

In step (4) of Reaction Scheme XIII, the alkene group of a compound of Formula LXII reacts with a nitron of Formula LXIII or LXIV to provide a heterocyclyl-substituted

1*H*-imidazo[4,5-*c*]quinoline of Formula LXV. Nitrones of Formula LXIII are known and can be prepared by known methods. See, for example, Dicken, C. M. and DeShong, P., *J. Org. Chem.*, 47, pp.2047-2051 (1982). Nitrones of Formula LXIV can be prepared according to the literature procedures: Thesing, J.; Sirrenberg, W., *Chem. Ber.*, 92, p. 1748, (1959) and Iwashita, T. et al., *J. Org. Chem.*, 47, p. 230, (1982). The cycloaddition reaction shown in step (4) can be carried out by combining the nitrone of Formula LXIII or LXIV with a compound of Formula LXII in a suitable solvent such as toluene and heating at an elevated temperature, for example, the reflux temperature of the solvent. Nitrones of Formula LXIII can also be prepared in situ by combining a hydroxylamine of Formula R<sub>4</sub>-NH-OH or a hydrochloride salt thereof and an aldehyde or ketone of Formula (R'')<sub>2</sub>C=O with a compound of Formula LXII in the presence of a base such as sodium bicarbonate and alumina. The reaction can be carried out at an elevated temperature in a suitable solvent such as toluene.

In step (5) of Reaction Scheme XIII, a heterocyclyl-substituted compound of Formula LXV is aminated to provide a heterocyclyl-substituted 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula XIIIa, a subgenus of Formulas XI and XIII. The reaction can be carried out according to the method described in step (2) of Reaction Scheme 2.

Reaction Scheme XIII

Imidazoquinolin-4-amines of the invention can also be prepared according to Reaction Scheme XIV, wherein  $R_{a2}$ ,  $R_{2-3}$ ,  $R''$ ,  $X''$ ,  $Q$ ,  $R_4$ , and  $n$  are as defined above. In step (1) of Reaction Scheme XIV, an isoxazolidine-substituted 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula LXVI undergoes reductive cleavage to provide an amino alcohol of Formula LXVII. The reaction is conveniently carried out under heterogeneous hydrogenation conditions in the presence of a heterogeneous hydrogenation catalyst such as palladium on carbon. The reaction can be carried out in a suitable solvent or solvent combination such as methanol:acetic acid.

In step (2) of Reaction Scheme XIV, an amino alcohol of Formula LXVII is converted to an oxazolidinone of Formula LXVIII using an appropriate coupling reagent such as 1,1'-carbonyldiimidazole. The reaction is conveniently carried out by heating, for example at reflux, the amino alcohol of Formula LXVII and 1,1'-carbonyldiimidazole in a suitable solvent such as tetrahydrofuran. Steps (1) and (2) of Reaction Scheme XIV can

also be carried out when the nitrogen of the oxazolidine ring is substituted by an  $R_4$  group other than hydrogen.

In steps (1a) and (3) of Reaction Scheme XIV, compounds of the Formulas LXVI and LXVIII can be converted to substituted oxazolidines and oxazolidinones of Formulas LXVIa and LXVIIIa using the one of the methods described in step (2) of Reaction Scheme VII and step (6) of Reaction Scheme IX.

Reaction Scheme XIV

Heterocycl-yl-substituted compounds of the invention can be prepared according to Reaction Scheme XV, wherein  $R_{A-2a}$ ,  $R_{B-2b}$ ,  $X''$ , and  $R_{2-3}$  are as defined above, and  $R_{1-3b}$  is a subset of  $R_{1-3}$  that includes the rings:

wherein  $Q_b$  is a bond and  $R''$ ,  $R_3$ , and  $R_4$  are defined as above. In step (1) of Reaction Scheme XV, a compound of Formula LXIX is reacted with an amino alcohol of the Formula  $H_2N-X''-OH$  to form a compound of Formula LXX. The reaction is conveniently carried out according to the method described in step (1) of Reaction Scheme XIII. Many 2,4-dichloro-3-nitropyridines of the Formula LXIX are known and can be readily prepared using known synthetic methods. See, for example, Dellaria et al, U.S. Pat. No. 6,525,064 and the references cited therein. Many 2,4-dichloro-3-nitroquinolines are also known and can be prepared by known methods; see, for example, U.S. Patent No. 4,988,815 (André et al). Related routes to tetrahydroquinolines of Formula LXX are known; see, for example, U.S. Patent Nos. 5,352,784 (Nikolaides et al) and 6,670,372 (Charles et al).

In step (2) of Reaction Scheme XV a compound of Formula LXX is reacted with an alkali metal azide to provide a tetrazole of Formula LXXI. The reaction can be carried out by combining the compound of Formula LXX with an alkali metal azide, for example, sodium azide, in a suitable solvent such as acetonitrile/water, preferably 90/10 acetonitrile/water, in the presence of cerium (III) chloride, preferably cerium (III) chloride heptahydrate. Optionally, the reaction can be carried out with heating, for example, at the reflux temperature. Alternatively, the reaction can be carried out by combining the compound of Formula LXX with an alkali metal azide, for example, sodium azide, in a suitable solvent such as DMF and heating, for example to about 50 °C to 60 °C, optionally in the presence of ammonium chloride. Other related routes to imidazonaphthyridines of Formula LXXI have been reported; see, for example, U.S. Patent No. 6,194,425 (Gerster et al).

In step (3) of Reaction Scheme XV, the nitro group of the compound of Formula LXXI is reduced to provide a diamine of Formula LXXII. The reduction can be carried out according to the methods described in step (2) of Reaction Scheme XI.

In step (4) of Reaction Scheme XV, a diamine of Formula LXXII is reacted with a carboxylic acid equivalent to provide a compound of Formula LXXIII. The reaction can be carried out as described in step (3) of Reaction Scheme XI.

In step (5) of Reaction Scheme XV, the alcohol of Formula LXXIII is oxidized to an aldehyde-substituted compound of Formula LXXIV using conventional methods, for example, Swern oxidation conditions. The Swern oxidation is conveniently carried out by adding a compound of Formula LXXIII followed by triethylamine to a mixture of oxalyl chloride and dimethylsulfoxide in a suitable solvent, such as dichloromethane. The reaction can be carried out at sub-ambient temperatures, such as -78 °C.

In step (6) of Reaction Scheme XV, an aldehyde-substituted compound of Formula LXXIV is converted to an alkenyl-substituted compound of Formula LXXV. The reaction can be carried out using synthetic methods well known to those skilled in the art; such methods include the Wittig reaction.

In step (7) of Reaction Scheme XV, the alkene dipolarophile of Formula LXXV undergoes a cycloaddition reaction with a nitron of Formula LXIII or LXIV to provide a heterocyclyl-substituted compound of Formula LXXVI wherein  $R_{1-3b}$  is

The reaction can be run according to one of the methods described in step (4) of Reaction Scheme XIII to provide a product of Formula LXXVI.

Compounds of Formula LXXVI wherein  $R_{1-3b}$  is

can be prepared according to step (6a) of Reaction Scheme XV. The transformation can be carried out by converting an aldehyde of Formula LXXIV to a nitron using one of the methods described in step (4) of Reaction Scheme XIII. The nitron can then undergo cycloaddition with an alkene of formula  $R'-CH=CH_2$  according to one of the methods described in step (4) of Reaction Scheme XIII. Numerous alkenes of this formula are commercially available; others can be prepared by known methods. The reaction may be carried out in one step if the nitron is generated in situ in the presence of an alkene.

In step (8) of Reaction Scheme XV, the tetrazole ring is removed from a compound of Formula LXXVI by reaction with triphenylphosphine to form an *N*-triphenylphosphinyl

intermediate. The reaction with triphenylphosphine can be run in a suitable solvent such as toluene or 1,2-dichlorobenzene under an atmosphere of nitrogen with heating, for example at the reflux temperature. The *N*-triphenylphosphinyl intermediate is then hydrolyzed to provide a compound of Formula XIa, a subgenus of Formula XI.

Reaction Scheme XV

Tetrahydroquinolines and tetrahydronaphthyridines of the invention can be prepared according to Reaction Scheme XVI, wherein  $R_{Ya}$ ,  $R_{Za}$ ,  $R_W$ ,  $R_X$ ,  $R_{1d}$ , and  $X'_b$  are as defined above, P is a hydroxy protecting group, and  $R_{2z-1}$  is a subset of  $R_{2z}$  as defined above in which  $X'''$  is  $C_{1-4}$  alkylene.

In step (1) of Reaction Scheme XVI, a compound of Formula XXXa or a salt thereof is reacted with a carboxylic acid or an equivalent thereof to provide a compound of Formula LXXVII. Compounds of Formula XXXa are a subset of compounds of Formula

XXX, which are shown in Reaction Scheme I. Suitable carboxylic acid equivalents that can be used to provide a compound of formula LXXVII include acid anhydrides of formula  $O[C(O)-X'_b-CH_2-O-P]_2$  and acid chlorides of formula  $Cl-C(O)-X'_b-CH_2-O-P$ . The reaction is conveniently carried out by under the conditions described in step (1) of Reaction Scheme I for the reaction with acid chlorides of formula  $Hal-X'-C(O)Cl$ . Some compounds of formula  $Cl-C(O)-X'_b-O-P$ , such as acetoxyacetyl chloride, methoxyacetyl chloride, and 2-methoxypropionyl chloride, are commercially available. Others can be prepared by known synthetic methods.

Alternatively, step (1) can be carried out in two steps by first heating a quinoline-3,4-diamine of Formula XXXa with a carboxylic acid of formula  $HO-X'_b-CO_2H$ , with a trialkyl orthoester of formula  $HO-X'_b-C(O-C_{1-4} \text{ alkyl})_3$ , or with a combination thereof to provide a hydroxy-substituted compound. The reaction is run with sufficient heating to drive off any alcohol or water formed as a byproduct of the reaction and is typically run at about 130 °C. The resultant hydroxy-substituted compound is protected with a removable protecting group such as an alkanoyloxy group (e.g., acetoxy) or aroyloxy group (e.g., benzoyloxy) to provide a compound of Formula LXXVII. Suitable protecting groups and reactions for their placement and removal are well known to those skilled in the art. See, for example, U.S. Patent No. 4,689,338 (Gerster), Examples 115 and 120 and 5,389,640 (Gerster et al.), Examples 2 and 3.

In steps (2) and (3) of Reaction Scheme XVI, a protected hydroxy-substituted imidazoquinoline or imidazonaphthyridine of Formula LXXVII is first oxidized to an *N*-oxide of Formula LXXVIII, which is then aminated to a compound of Formula LXXIX. Steps (2) and (3) of Reaction Scheme XVI can be carried out as described for steps (2) and (3) of Reaction Scheme I. Under the amination reaction conditions, some protecting groups are removed; for example, an ester group such as an acetoxy group would be hydrolyzed under these conditions. Other hydroxy protecting groups may need to be removed in a subsequent step prior to step (4) to provide a compound of Formula LXXIX. For example, a methyl ether, wherein P is methyl, can be dealkylated by treatment with boron tribromide in a suitable solvent such as dichloromethane at a sub-ambient temperature such as 0 °C.

In step (4) of Reaction Scheme XVI, a compound of Formula LXXIX is reduced according to the method described in Reaction Scheme X to provide a hydroxy-substituted

6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-4-amine or 6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]naphthyridin-4-amine of Formula LXXX.

In step (5) of Reaction Scheme XVI, a compound of Formula LXXX is halogenated using conventional methods to provide a compound of Formula LXXXI. For example, a hydroxy-substituted compound of Formula LXXX can be combined with thionyl chloride in a suitable solvent such as dichloromethane or 1,2-dichloroethane at room temperature.

In step (6) of Reaction Scheme XVI, a halogen-substituted compound of Formula LXXXI is treated according to any of the methods or combination of methods described in Reaction Schemes I, III, IV, V, VII, and VIII to introduce the  $R_{2z}$  group and provide a compound of Formula LXXXII. The transformation can be carried out according to one of the methods described in step (4) of Reaction Scheme IX.

#### Reaction Scheme XVI

Compounds of the invention can also be prepared using variations of the synthetic routes shown in Reaction Schemes I through XVI that would be apparent to one of skill in the art. For example, the synthetic route shown in Reaction Scheme XI for the preparation of quinolines can be used to prepare [1,5]naphthyridines by starting with a 4-chloro-3-nitro[1,5]naphthyridine in lieu of the 4-chloro-3-nitroquinoline. In another example, the methods described in Reaction Scheme XVI can be used to install a hydroalkyl group at the R<sub>2-2</sub> or R<sub>2-3</sub> position shown in Reaction Scheme XI, XIII, or XV. Also, the methods shown in Reaction Scheme XIV can be carried out on a compound wherein wherein R<sub>1-3</sub> is

Compounds of the invention can also be prepared using the synthetic routes described in the EXAMPLES below.

Prodrugs can be prepared in a variety of ways. For example, a compound wherein R<sub>1</sub> or R<sub>2</sub> is hydroxyalkyl can be converted into a prodrug wherein R<sub>1</sub> or R<sub>2</sub> is, for example, an ester, an ether, a carbonate, or a carbamate, using methods known to one skilled in the art. In addition, a compound wherein R<sub>b</sub> is hydroxy may also be converted to an ester, an ether, a carbonate, or a carbamate. For any of these compounds containing an alcohol functional group, a prodrug can be formed by the replacement of the hydrogen atom of the alcohol group with a group such as C<sub>1-6</sub> alkanoyloxymethyl, 1-(C<sub>1-6</sub> alkanoyloxy)ethyl, 1-methyl-1-(C<sub>1-6</sub> alkanoyloxy)ethyl, C<sub>1-6</sub> alkoxycarbonyloxymethyl, N-(C<sub>1-6</sub> alkoxycarbonyl)aminomethyl, succinoyl, C<sub>1-6</sub> alkanoyl, α-aminoC<sub>1-4</sub> alkanoyl, arylacyl, -P(O)(OH)<sub>2</sub>, -P(O)(O-C<sub>1-6</sub> alkyl)<sub>2</sub>, C<sub>1-6</sub> alkoxycarbonyl, C<sub>1-6</sub> alkylcarbamoyl, and α-aminoacyl or α-aminoacyl-α-aminoacyl, where each α-aminoacyl group is independently selected from racemic, D-, and L-amino acids. For compounds containing an alcohol functional group, particularly useful prodrugs are esters made from carboxylic acids containing one to six carbon atoms, unsubstituted or substituted benzoic acid esters, or esters made from amino acids.

Prodrugs can also be made from a compound containing an amino group by conversion of the amino group to a functional group such as an amide, carbamate, urea, amidine, or another hydrolyzable group using conventional methods. A prodrug of this

type can be made by the replacement of a hydrogen atom in an amino group, particularly the amino group at the 4-position, with a group such as  $-C(O)-R'''$ ,  $\alpha$ -aminoacyl,  $\alpha$ -aminoacyl- $\alpha$ -aminoacyl,  $-C(O)-O-R'''$ ,  $-C(O)-N(R''')-R'''$ ,  $-C(=NY_5)-R'''$ ,  $-CH(OH)-C(O)-OY_5$ ,  $-CH(OC_{1-4} \text{ alkyl})Y_0$ ,  $-CH_2Y_6$ , or  $-CH(CH_3)Y_6$ ; wherein  $R'''$  and  $R''''$  are each independently  $C_{1-10}$  alkyl,  $C_{3-7}$  cycloalkyl, or benzyl, each of which may be unsubstituted or substituted by one or more substituents selected from the group consisting of halogen, hydroxy, nitro, cyano, carboxy,  $C_{1-6}$  alkyl,  $C_{1-4}$  alkoxy, aryl, heteroaryl, aryl- $C_{1-4}$  alkylenyl, heteroaryl- $C_{1-4}$  alkylenyl, halo- $C_{1-4}$  alkylenyl, halo- $C_{1-4}$  alkoxy,  $-O-C(O)-CH_3$ ,  $-C(O)-O-CH_3$ ,  $-C(O)-NH_2$ ,  $-O-CH_2-C(O)-NH_2$ ,  $-NH_2$ , and  $-S(O)_2-NH_2$ ; with the proviso that  $R''''$  may also be hydrogen; each  $\alpha$ -aminoacyl group is independently selected from racemic, D, or L-amino acids;  $Y_5$  is hydrogen,  $C_{1-6}$  alkyl, or benzyl;  $Y_0$  is  $C_{1-6}$  alkyl, carboxy- $C_{1-6}$  alkylenyl, amino- $C_{1-4}$  alkylenyl, mono-*N*- $C_{1-6}$  alkylamino- $C_{1-4}$  alkylenyl, or di-*N,N*- $C_{1-6}$  alkylamino- $C_{1-4}$  alkylenyl; and  $Y_6$  is mono-*N*- $C_{1-6}$  alkylamino, di-*N,N*- $C_{1-6}$  alkylamino, morpholin-4-yl, piperidin-1-yl, pyrrolidin-1-yl, or 4- $C_{1-4}$  alkylpiperazin-1-yl. For compounds containing an amine functional group, particularly useful prodrugs are amides derived from carboxylic acids containing one to ten carbon atoms, amides derived from amino acids, and carbamates containing one to ten carbon atoms.

## Pharmaceutical Compositions and Biological Activity

Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound or salt of the invention as described above in combination with a pharmaceutically acceptable carrier.

The terms "a therapeutically effective amount" and "effective amount" mean an amount of the compound or salt sufficient to induce a therapeutic or prophylactic effect, such as cytokine induction, immunomodulation, antitumor activity, and/or antiviral activity. Although the exact amount of active compound or salt used in a pharmaceutical composition of the invention will vary according to factors known to those of skill in the art, such as the physical and chemical nature of the compound or salt, the nature of the carrier, and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 nanograms per kilogram (ng/kg) to about 50 milligrams per kilogram (mg/kg), preferably

about 10 micrograms per kilogram ( $\mu\text{g/kg}$ ) to about 5 mg/kg, of the compound or salt to the subject. A variety of dosage forms may be used, such as tablets, lozenges, capsules, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

5           The compounds or salts of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds or salts of the invention may be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, antibodies, proteins, peptides, oligonucleotides, etc.

10           Compounds or salts of the invention have been shown to induce the production of certain cytokines in experiments performed according to the test set forth below. These results indicate that the compounds or salts are useful as immune response modifiers that can modulate the immune response in a number of different ways, rendering them useful in the treatment of a variety of disorders.

15           Cytokines whose production may be induced by the administration of compounds or salts of the invention generally include interferon- $\alpha$  (IFN- $\alpha$ ) and/or tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by compounds or salts of the invention include IFN- $\alpha$ , TNF- $\alpha$ , IL-1, IL-6, IL-10 and IL-12, and a variety of other cytokines. Among other effects, these and other  
20           cytokines can inhibit virus production and tumor cell growth, making the compounds or salts useful in the treatment of viral diseases and neoplastic diseases. Accordingly, the invention provides a method of inducing cytokine biosynthesis in an animal comprising administering an effective amount of a compound or salt or composition of the invention to the animal. The animal to which the compound or salt or composition is administered  
25           for induction of cytokine biosynthesis may have a disease as described *infra*, for example a viral disease or a neoplastic disease, and administration of the compound or salt may provide therapeutic treatment. Alternatively, the compound or salt may be administered to the animal prior to the animal acquiring the disease so that administration of the  
30           compound or salt may provide a prophylactic treatment.

          In addition to the ability to induce the production of cytokines, compounds or salts of the invention can affect other aspects of the innate immune response. For example, natural killer cell activity may be stimulated, an effect that may be due to cytokine

induction. The compounds or salts may also activate macrophages, which in turn stimulate secretion of nitric oxide and the production of additional cytokines. Further, the compounds or salts may cause proliferation and differentiation of B-lymphocytes.

Compounds or salts of the invention can also have an effect on the acquired  
5 immune response. For example, the production of the T helper type 1 (T<sub>H</sub>1) cytokine IFN- $\gamma$  may be induced indirectly and the production of the T helper type 2 (T<sub>H</sub>2) cytokines IL-4, IL-5 and IL-13 may be inhibited upon administration of the compounds or salts.

Whether for prophylaxis or therapeutic treatment of a disease, and whether for effecting innate or acquired immunity, the compound or salt or composition may be  
10 administered alone or in combination with one or more active components as in, for example, a vaccine adjuvant. When administered with other components, the compound or salt and other component or components may be administered separately; together but independently such as in a solution; or together and associated with one another such as (a) covalently linked or (b) non-covalently associated, e.g., in a colloidal suspension.

15 Conditions for which compounds or salts identified herein may be used as treatments include, but are not limited to:

(a) viral diseases such as, for example, diseases resulting from infection by an adenovirus, a herpesvirus (e.g., HSV-I, HSV-II, CMV, or VZV), a poxvirus (e.g., an orthopoxvirus such as variola or vaccinia, or molluscum contagiosum), a picornavirus  
20 (e.g., rhinovirus or enterovirus), an orthomyxovirus (e.g., influenzavirus), a paramyxovirus (e.g., parainfluenzavirus, mumps virus, measles virus, and respiratory syncytial virus (RSV)), a coronavirus (e.g., SARS), a papovavirus (e.g., papillomaviruses, such as those that cause genital warts, common warts, or plantar warts), a hepadnavirus (e.g., hepatitis B virus), a flavivirus (e.g., hepatitis C virus or Dengue virus), or a retrovirus (e.g., a  
25 lentivirus such as HIV);

30 *Corynebacterium*, *Mycobacterium*, *Campylobacter*, *Vibrio*, *Serratia*, *Providencia*, *Chromobacterium*, *Brucella*, *Yersinia*, *Haemophilus*, or *Bordetella*;

(c) other infectious diseases, such chlamydia, fungal diseases including but not limited to candidiasis, aspergillosis, histoplasmosis, cryptococcal meningitis, or parasitic diseases including but not limited to malaria, pneumocystis carinii pneumonia, leishmaniasis, cryptosporidiosis, toxoplasmosis, and trypanosome infection;

5 (d) neoplastic diseases, such as intraepithelial neoplasias, cervical dysplasia, actinic keratosis, basal cell carcinoma, squamous cell carcinoma, renal cell carcinoma, Kaposi's sarcoma, melanoma, leukemias including but not limited to myelogenous leukemia, chronic lymphocytic leukemia, multiple myeloma, non-Hodgkin's lymphoma, cutaneous T-cell lymphoma, B-cell lymphoma, and hairy cell leukemia, and other cancers;

10 (e)  $T_H2$ -mediated, atopic diseases, such as atopic dermatitis or eczema, eosinophilia, asthma, allergy, allergic rhinitis, and Ommen's syndrome;

15 (g) diseases associated with wound repair such as, for example, inhibition of keloid formation and other types of scarring (e.g., enhancing wound healing, including chronic wounds).

Additionally, a compound or salt of the present invention may be useful as a vaccine adjuvant for use in conjunction with any material that raises either humoral and/or cell mediated immune response, such as, for example, live viral, bacterial, or parasitic immunogens; inactivated viral, tumor-derived, protozoal, organism-derived, fungal, or  
20 bacterial immunogens; toxoids; toxins; self-antigens; polysaccharides; proteins; glycoproteins; peptides; cellular vaccines; DNA vaccines; autologous vaccines; recombinant proteins; and the like, for use in connection with, for example, BCG, cholera, plague, typhoid, hepatitis A, hepatitis B, hepatitis C, influenza A, influenza B,  
25 parainfluenza, polio, rabies, measles, mumps, rubella, yellow fever, tetanus, diphtheria, hemophilus influenza b, tuberculosis, meningococcal and pneumococcal vaccines, adenovirus, HIV, chicken pox, cytomegalovirus, dengue, feline leukemia, fowl plague, HSV-1 and HSV-2, hog cholera, Japanese encephalitis, respiratory syncytial virus, rotavirus, papilloma virus, yellow fever, and Alzheimer's Disease.

30 Compounds or salts of the present invention may be particularly helpful in individuals having compromised immune function. For example, compounds or salts may be used for treating the opportunistic infections and tumors that occur after suppression of

cell mediated immunity in, for example, transplant patients, cancer patients and HIV patients.

Thus, one or more of the above diseases or types of diseases, for example, a viral disease or a neoplastic disease may be treated in an animal in need thereof (having the  
5 disease) by administering a therapeutically effective amount of a compound or salt of the invention to the animal.

An amount of a compound or salt effective to induce cytokine biosynthesis is an amount sufficient to cause one or more cell types, such as monocytes, macrophages, dendritic cells and B-cells to produce an amount of one or more cytokines such as, for example, IFN- $\alpha$ ,  
10 TNF- $\alpha$ , IL-1, IL-6, IL-10 and IL-12 that is increased (induced) over a background level of such cytokines. The precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10  $\mu$ g/kg to about 5 mg/kg. The invention also provides a method of treating a viral infection in an animal and a method of treating a neoplastic disease in an animal comprising  
15 administering an effective amount of a compound or salt or composition of the invention to the animal. An amount effective to treat or inhibit a viral infection is an amount that will cause a reduction in one or more of the manifestations of viral infection, such as viral lesions, viral load, rate of virus production, and mortality as compared to untreated control animals. The precise amount that is effective for such treatment will vary according to  
20 factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10  $\mu$ g/kg to about 5 mg/kg. An amount of a compound or salt effective to treat a neoplastic condition is an amount that will cause a reduction in tumor size or in the number of tumor foci. Again, the precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg,  
25 preferably about 10  $\mu$ g/kg to about 5 mg/kg.

WO 03/077944 and WO 02/036592, U.S. Patent No. 6,245,776, and U.S. Publication Nos. 2003/0139364,  
30 2003/185835, 2004/0258698, 2004/0265351, 2004/076633, and 2005/0009858.

## EXAMPLES

Objects and advantages of this invention are further illustrated by the following examples, but the particular materials and amounts thereof recited in these examples, as well as other conditions and details, should not be construed to unduly limit this invention.

5

In the examples below automated flash chromatography was carried out using a COMBIFLASH system (an automated high-performance flash purification product available from Teledyne Isco, Inc., Lincoln, Nebraska, USA), a HORIZON HPFC system (an automated high-performance flash purification product available from Biotage, Inc., Charlottesville, Virginia, USA) or a combination thereof. For some of these purifications, either a FLASH 40+M silica cartridge or a FLASH 65I silica cartridge (both available from Biotage, Inc, Charlottesville, Virginia, USA) was used. The eluent used for each purification is given in the example. In some chromatographic separations, the solvent mixture 80/18/2 v/v/v chloroform/methanol/concentrated ammonium hydroxide (CMA) was used as the polar component of the eluent. In these separations, CMA was mixed with chloroform in the indicated ratio.

agent, and then concentrated under reduced pressure to provide 52.81 g of 2-(chloromethyl)-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinoline as a brown solid.

#### Part B

3-Chloroperoxybenzoic acid (mCPBA) (32.7 g of 77% pure material, 146 mmol) was added over a period of five minutes to a solution of 2-(chloromethyl)-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinoline (20.0 g, 73.1 mmol) in chloroform (500 mL); the reaction mixture was stirred at ambient temperature for one hour. Ammonium hydroxide (200 mL) was added, and then *p*-toluenesulfonyl chloride (16.7 g, 87.7 mmol) was added in portions over a period of 10 minutes. The reaction mixture was stirred at ambient temperature for one hour, and then water (200 mL) was added. The aqueous layer was separated and extracted with dichloromethane (2 x 200 mL). The combined organic fractions were dried over magnesium sulfate, filtered, and concentrated under reduced pressure to provide 32 g of crude product as a tan solid. The crude product was dissolved in dichloromethane (50 mL), and the resulting solution was divided into two portions. Each portion was purified by automated flash chromatography on a HORIZON HPFC system using a FLASH 65I silica cartridge (eluting with ethyl acetate:methanol in a gradient from 98:2 to 85:15) to provide 11.24 g of 2-(chloromethyl)-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-4-amine as a tan solid.

#### Part C

The reaction mixture was stirred at ambient temperature overnight, and then water (300 mL) was added. The resulting mixture was stirred for 15 minutes, and the precipitate was isolated by filtration, washed with water, and dried overnight in a vacuum oven at 65 °C to provide 9.71 g of 2-{{[4-amino-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-2-yl]methyl}-1*H*-isoindole-1,3(2*H*)-dione.

#### Part D

A solution of chloroacetyl chloride (21.0 mL, 0.257 mol) in dichloromethane (50 mL) was added dropwise to the mixture at room temperature. The mixture was stirred for 2.5 days

at room temperature. The resulting solution was concentrated under reduced pressure, and the residue was partitioned between ethyl acetate (0.5 L) and a solution of 1:1 saturated aqueous sodium bicarbonate/water (0.5 L). The aqueous layer was extracted with ethyl acetate (3 x 250 mL) and chloroform (250 mL). The combined organic layers were dried

30 mmol) in DMF (15 mL). The reaction mixture was stirred at room temperature for two days. Water (150 mL) was added to the mixture, which was stirred for an additional 10 minutes. The solid material was filtered, washed with water, and dried overnight in a

vacuum oven to afford 1.2 g of 2-{{[4-amino-1-(2-hydroxy-2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-2-yl]methyl}-1*H*-isoindole-1,3(2*H*)-dione as a tan solid.

Part D

The solid was filtered off, and analysis by proton nuclear magnetic resonance spectroscopy (<sup>1</sup>H NMR) indicated the presence of intermediate. The material was dissolved in a 2N methanolic ammonia solution and heated in a sealed vessel overnight at 150 °C. The mixture was concentrated under reduced pressure, extracted with dichloromethane, and washed with water. The organic layers were separated, dried over magnesium sulfate, and concentrated under reduced pressure to afford 1.5 g of 1-{2-[(benzyloxy)methyl]-1*H*-imidazo[4,5-*c*]quinolin-1-yl}-2-methylpropan-2-ol as an oil.

### Example 300

2-(Ethoxymethyl)-1-[(2-methylisoxazolidin-5-yl)methyl]-1*H*-imidazo[4,5-*c*]quinolin-4-amine

#### Part A

Triethylamine (17.0 mL, 123 mmol) was added to a 0 °C solution of 2,4-dichloro-3-nitroquinoline (20.0 g, 82.3 mmol) in dichloromethane (350 mL) followed by the dropwise addition of allylamine (5.90 mL, 78.2 mmol). The solution was allowed to stir and warm to room temperature overnight. The solvent was evaporated under reduced pressure and the resulting orange solid was suspended in water (300 mL). Solid sodium carbonate was added to adjust the pH to 10-11 and the suspension was stirred for 2 hours at 0 °C. A yellow solid was isolated by filtration and dried under vacuum overnight to yield *N*-allyl-2-chloro-3-nitroquinolin-4-amine (21.7 g) that contained small amounts of an impurity and water.

#### Part B

An aqueous solution (200 mL) of potassium carbonate (55.3 g, 400 mmol) and sodium dithionite (62.7 g, 360 mmol) was added dropwise over 30 minutes to a mixture of *N*-allyl-2-chloro-3-nitroquinolin-4-amine (21.0 g, 79.9 mmol) and ethyl viologen dibromide (1.80 g, 4.80 mmol) in dichloromethane (320 mL) and water (40 mL) under a nitrogen atmosphere. The dark blue-green mixture was stirred rapidly and was heated at

reflux overnight. The mixture was transferred to a separatory funnel and the layers were separated. The aqueous layer was extracted with dichloromethane. The combined organic layers were filtered through CELITE filter agent, dried over MgSO<sub>4</sub>, filtered, and concentrated to a dark oil. The crude product was purified by suction filter chromatography (silica gel, gradient elution from 3:1 to 1:3 hexanes/ethyl acetate, then 4:1 dichloromethane/ethyl acetate) to afford pure product *N*<sup>4</sup>-allyl-2-chloroquinoline-3,4-diamine (12.06 g) along with some impure product (3.10 g).

#### Part C

Ethoxyacetyl chloride (8.80 g, 71.8 mmol) was added dropwise to a solution of *N*<sup>4</sup>-allyl-2-chloroquinoline-3,4-diamine (15.2 g, 65.3 mmol) in acetonitrile (300 mL) at room temperature. After 45 min, the reaction mixture was filtered and an orange solid (approximately 17 g) was isolated. The solid was dissolved in a solution of ethanol (240 mL) and water (80 mL). Sodium hydroxide (3.92 g, 98.0 mmol) was added and the solution was heated at reflux for 2 hours. The ethanol was removed under reduced pressure and the remaining aqueous solution was extracted several times with dichloromethane. The combined organic layers were dried over MgSO<sub>4</sub>, filtered, and concentrated to an orange solid. The solid was triturated with ethyl acetate and isolated by filtration to yield 6 g of a pale yellow solid. The filtrate was concentrated and purified by suction filter chromatography (silica gel with 97:3 dichloromethane/methanol as the eluent) to yield an additional 5 g of product. The material was combined to provide 11 g of 1-allyl-4-chloro-2-(ethoxymethyl)-1*H*-imidazo[4,5-*c*]quinoline.

Additional *N*-methylhydroxylamine hydrochloride (305 mg), sodium bicarbonate (475 mg), and paraformaldehyde (500 mg) were added and the mixture was heated at reflux overnight. The mixture was filtered through CELITE filter agent and concentrated under reduced pressure. The crude product was purified by flash chromatography (silica gel, elution with 97:3 dichloromethane/methanol) to yield 1.40 g of 4-chloro-2-(ethoxymethyl)-1-[(2-

methylisoxazolidin-5-yl)methyl]-1*H*-imidazo[4,5-*c*]quinoline as tan oil. Some starting material (500 mg) was also recovered.

## Examples 315 - 335

## Part A

25           A mixture of [4-amino-1-(2-methylpropyl)-1*H*-imidazo[4,5-*c*]quinolin-2-yl]methanol (10.9 g, 40.3 mmol, U.S. Pat. No. 5,389,640 Example 9), platinum(IV) oxide (5.5 g), and trifluoroacetic acid (75 mL) was placed under hydrogen pressure (50 psi,  $3.4 \times$

10<sup>5</sup> Pa) on a Parr apparatus for two days. The mixture was diluted with dichloromethane (200 mL) and filtered through CELITE filter agent; the filter cake was washed with dichloromethane. The filtrate was concentrated under reduced pressure, and the residue was partitioned between dichloromethane (200 mL) and water (200 mL). The mixture was adjusted to pH 10 with the addition of solid sodium carbonate. The aqueous layer was separated and extracted with dichloromethane (2 x 200 mL). A solid was present in the aqueous layer and was isolated by filtration, washed with water, and combined with the organic fractions. The combined organic fractions were concentrated under reduced pressure and purified by automated flash chromatography using a HORIZON HPFC system (silica gel, eluting with dichloromethane:1 M ammonia in methanol in a gradient from 95:5 to 80:20) to afford 4.92 g of [4-amino-1-(2-methylpropyl)-6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-2-yl]methanol as a grey solid.

#### Part B

Thionyl chloride (1.56 mL, 21.4 mmol) was added to a stirred suspension of [4-amino-1-(2-methylpropyl)-6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-2-yl]methanol (4.92 g, 17.9 mmol) in 1,2-dichloroethane (180 mL). The reaction became homogeneous, and then a precipitate formed after five minutes. The reaction mixture was stirred at room temperature for 1.5 hours and concentrated under reduced pressure to yield 2-(chloromethyl)-1-(2-methylpropyl)-6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-4-amine hydrochloride as a tan solid.

#### Part C

A cyclic amine (0.15 mmol, 1.5 equivalents) from the table below was added to a test tube containing 2-(chloromethyl)-1-(2-methylpropyl)-6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-4-amine hydrochloride (33 mg, 0.10 mmol), potassium carbonate (0.055 g, 0.40 mmol), and DMA (1 mL). The test tube was capped and heated for ten hours at 70 °C. Each reaction mixture was allowed to cool to room temperature and filtered, and the filter cake was washed with DMA (0.200 mL). The solvent was removed from each filtrate by vacuum centrifugation.

The compounds were purified by reversed phase prep HPLC using a Waters FractionLynx automated purification system. The prep HPLC fractions were analyzed using a Waters LC/TOF-MS, and the appropriate fractions were centrifuge evaporated to provide the trifluoroacetate salt of the desired compound. Reversed phase preparative

liquid chromatography was performed with non-linear gradient elution from 5-95% B where A is 0.05% trifluoroacetic acid/water and B is 0.05% trifluoroacetic acid/acetonitrile. Fractions were collected by mass-selective triggering. The table below shows the reagent added to each test tube, the structure of the resulting compound, and the observed accurate mass for the isolated trifluoroacetate salt.

Compounds of the invention have been found to modulate cytokine biosynthesis by inducing the production of interferon  $\alpha$  and/or tumor necrosis factor  $\alpha$  in human cells when tested using the methods described below.

#### CYTOKINE INDUCTION IN HUMAN CELLS

An in vitro human blood cell system is used to assess cytokine induction. Activity is based on the measurement of interferon ( $\alpha$ ) and tumor necrosis factor ( $\alpha$ ) (IFN- $\alpha$  and TNF- $\alpha$ , respectively) secreted into culture media as described by Testerman et. al. in "Cytokine Induction by the Immunomodulators Imiquimod and S-27609", *Journal of Leukocyte Biology*, 58, 365-372 (September, 1995).

#### Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Blood is diluted 1:1 with Dulbecco's Phosphate Buffered Saline (DPBS) or Hank's Balanced Salts Solution (HBSS). Alternately, whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected and washed twice with DPBS or HBSS and re-suspended at  $4 \times 10^6$  cells/mL in RPMI complete. The PBMC suspension is added to 96 well flat bottom sterile tissue culture plates containing an equal volume of RPMI complete media containing test compound.

### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1% for addition to the culture wells. The compounds are generally tested at concentrations ranging from 30-0.014  $\mu\text{M}$ . Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with reference compound.

### Incubation

The solution of test compound is added at 60  $\mu\text{M}$  to the first well containing RPMI complete and serial 3 fold dilutions are made in the wells. The PBMC suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the desired range (usually 30-0.014  $\mu\text{M}$ ). The final concentration of PBMC suspension is  $2 \times 10^6$  cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

### Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 x g) at 4°C. The cell-free culture supernatant is removed and transferred to sterile polypropylene tubes. Samples are maintained at -30 to -70°C until analysis. The samples are analyzed for IFN- $\alpha$  by ELISA and for TNF- $\alpha$  by IGEN/BioVeris Assay.

### Interferon ( $\alpha$ ) and Tumor Necrosis Factor ( $\alpha$ ) Analysis

IFN- $\alpha$  concentration is determined with a human multi-subtype colorimetric sandwich ELISA (Catalog Number 41105) from PBL Biomedical Laboratories, Piscataway, NJ. Results are expressed in pg/mL.

The TNF- $\alpha$  concentration is determined by ORIGEN M-Series Immunoassay and read on an IGEN M-8 analyzer from BioVeris Corporation, formerly known as IGEN International, Gaithersburg, MD. The immunoassay uses a human TNF- $\alpha$  capture and detection antibody pair (Catalog Numbers AHC3419 and AHC3712) from Biosource International, Camarillo, CA. Results are expressed in pg/mL.

### Assay Data and Analysis

In total, the data output of the assay consists of concentration values of TNF- $\alpha$  and IFN- $\alpha$  (y-axis) as a function of compound concentration (x-axis).

Analysis of the data has two steps. First, the greater of the mean DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ) is subtracted from each reading. If any negative values result from background subtraction, the reading is reported as " \* ", and is noted as not reliably detectable. In subsequent calculations and statistics, " \* ", is treated as a zero. Second, all background subtracted values are multiplied by a single adjustment ratio to decrease experiment to experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound based on the past 61 experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- $\alpha$ , $\alpha$ -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from the past 61 experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration ( $\mu$ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested cytokine (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.

### CYTOKINE INDUCTION IN HUMAN CELLS

#### (High Throughput Screen)

The CYTOKINE INDUCTION IN HUMAN CELLS test method described above was modified as follows for high throughput screening.

#### Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells

(PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected and washed twice with DPBS or HBSS and re-suspended at  $4 \times 10^6$  cells/mL in RPMI complete (2-fold the final cell density). The PBMC suspension is added to 96-well flat bottom sterile tissue culture plates.

#### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The compounds are generally tested at concentrations ranging from 30 - 0.014  $\mu$ M. Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with a reference compound 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- $\alpha,\alpha$ -dimethyl-1H-imidazo[4,5-c]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) on each plate. The solution of test compound is added at 7.5 mM to the first well of a dosing plate and serial 3 fold dilutions are made for the 7 subsequent concentrations in DMSO. RPMI Complete media is then added to the test compound dilutions in order to reach a final compound concentration of 2-fold higher (60 - 0.028  $\mu$ M) than the final tested concentration range.

#### Incubation

Compound solution is then added to the wells containing the PBMC suspension bringing the test compound concentrations to the desired range (usually 30 - 0.014  $\mu$ M) and the DMSO concentration to 0.4 %. The final concentration of PBMC suspension is  $2 \times 10^6$  cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37°C in a 5% carbon dioxide atmosphere.

#### Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 g) at 4°C. 4-plex Human Panel MSD MULTI-SPOT 96-well plates are pre-coated with the appropriate capture antibodies by MesoScale Discovery, Inc. (MSD, Gaithersburg, MD). The cell-free culture supernatants are removed and transferred

to the MSD plates. Fresh samples are typically tested, although they may be maintained at -30 to -70°C until analysis.

#### Interferon- $\alpha$ and Tumor Necrosis Factor- $\alpha$ Analysis

5 MSD MULTI-SPOT plates contain within each well capture antibodies for human TNF- $\alpha$  and human IFN- $\alpha$  that have been pre-coated on specific spots. Each well contains four spots: one human TNF- $\alpha$  capture antibody (MSD) spot, one human IFN- $\alpha$  capture antibody (PBL Biomedical Laboratories, Piscataway, NJ) spot, and two inactive bovine serum albumin spots. The human TNF- $\alpha$  capture and detection antibody pair is from  
10 MesoScale Discovery. The human IFN- $\alpha$  multi-subtype antibody (PBL Biomedical Laboratories) captures all IFN- $\alpha$  subtypes except IFN- $\alpha$  F (IFNA21). Standards consist of recombinant human TNF- $\alpha$  (R&D Systems, Minneapolis, MN) and IFN- $\alpha$  (PBL Biomedical Laboratories). Samples and separate standards are added at the time of analysis to each MSD plate. Two human IFN- $\alpha$  detection antibodies (Cat. Nos. 21112 &  
15 21100, PBL) are used in a two to one ratio (weight:weight) to each other to determine the IFN- $\alpha$  concentrations. The cytokine-specific detection antibodies are labeled with the SULFO-TAG reagent (MSD). After adding the SULFO-TAG labeled detection antibodies to the wells, each well's electrochemoluminescent levels are read using MSD's SECTOR HTS READER. Results are expressed in pg/mL upon calculation with known cytokine  
20 standards.

#### Assay Data and Analysis

In total, the data output of the assay consists of concentration values of TNF- $\alpha$  or IFN- $\alpha$  (y-axis) as a function of compound concentration (x-axis).

25 A plate-wise scaling is performed within a given experiment aimed at reducing plate-to-plate variability associated within the same experiment. First, the greater of the median DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ) is subtracted from each reading. Negative values that may result from background subtraction are set to zero. Each plate within a given  
30 experiment has a reference compound that serves as a control. This control is used to calculate a median expected area under the curve across all plates in the assay. A plate-wise scaling factor is calculated for each plate as a ratio of the area of the reference

compound on the particular plate to the median expected area for the entire experiment. The data from each plate are then multiplied by the plate-wise scaling factor for all plates. Only data from plates bearing a scaling factor of between 0.5 and 2.0 (for both cytokines IFN- $\alpha$ , TNF- $\alpha$ ) are reported. Data from plates with scaling factors outside the above mentioned interval are retested until they bear scaling factors inside the above mentioned interval. The above method produces a scaling of the y-values without altering the shape of the curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- $\alpha,\alpha$ -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91). The median expected area is the median area across all plates that are part of a given experiment.

A second scaling may also be performed to reduce inter-experiment variability (across multiple experiments). All background-subtracted values are multiplied by a single adjustment ratio to decrease experiment-to-experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound based on an average of previous experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- $\alpha,\alpha$ -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from an average of previous experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration ( $\mu$ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested cytokine (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.
